I am not too concerned with the details of your implementation (that is for later). Right now i am curious waht you, as a student, found easy and difficult, thus far.

- Since I'm relatively new to Haskell, I've found that architecting larger projects is quite a challenge. In lectures, we usually get the individual puzzle pieces like how monads, parsing, or transformers work but we don't always see the big picture. Early on, it was really difficult to figure out how to fit all those pieces together into a more complex project.
- On the technical side, I struggled a bit with pointers and the FFI. Figuring out how to model errors was also a challenge I spent a lot of time trying to find a setup I liked. I'm still not sure I'm totally happy with it.
- On the other hand, functional parsing with Megaparsec was a great experience. It felt just like putting Legos together. Even when I didn't understand the inner workings in fine detail, the abstractions were so intuitive that I could still do what I wanted. This tutorial was a help in getting me started <https://markkarpov.com/tutorial/megaparsec.html>

Of course, if there are issues blocking your progress, mention those as well.

- None that i can think of now
